

Project Initialization and Planning Phase

Date	28 June 2026
Team ID	
Project Title	OptiCrop: Smart Agricultural Production Optimization Engine
Maximum Marks	5 Marks

Project Proposal (Proposed Solution) report :

Agriculture plays an important role in people's lives, but farmers often face difficulties in selecting the right crop because soil conditions and weather change from season to season. Choosing an unsuitable crop can lead to poor yield, higher farming costs, and loss of income. OptiCrop: Smart Agricultural Production Optimization Engine is designed to address this problem by using machine learning to analyze soil nutrients and environmental conditions. The system recommends the most suitable crop, helping farmers make informed decisions, improve productivity, and use available resources more efficiently.

Project Overview	
Objective	To develop a smart crop recommendation system that helps farmers identify the most suitable crop based on soil nutrients, temperature, humidity, pH, and rainfall, enabling better farming decisions and improved agricultural productivity.

Scope	The project focuses on analyzing soil and environmental data to provide crop recommendations. It can be used by farmers for crop selection and by agricultural researchers to study crop-environment relationships and support sustainable farming practices.
Problem Statement	
Description	Many farmers still depend on traditional farming practices or local advice when choosing crops. However, changing weather conditions and variations in soil nutrients make it difficult to decide which crop will grow best. This often leads to lower yields and inefficient use of water, fertilizers, and other resources.
Impact	Providing accurate crop recommendations can help farmers choose suitable crops, improve crop production, reduce unnecessary farming expenses, and make better use of available resources.
Proposed Solution	
Approach	OptiCrop uses a machine learning model that analyzes important agricultural factors such as Nitrogen (N), Phosphorous (P), Potassium (K), temperature, humidity, pH, and rainfall. Based on these inputs, the system predicts the most suitable crop and provides useful recommendations to support better farming decisions.
Key Features	• Smart crop recommendation based on soil and weather conditions • Soil and crop suitability analysis • Fast and accurate machine learning predictions • Simple and easy-to-use web interface • Better utilization of water and fertilizers • Data-driven support for sustainable farming

Resource Requirements

Resource Type	Description	Specification/Allocation
Hardware		
Computing Resources	CPU specifications, number of cores	Intel Core i3/i5 or above (4+ CPU cores)
Memory	RAM specifications	Minimum 4 GB
Storage	Disk space for data, models, and logs	Minimum 10 GB free space
Software		
Frameworks	Python frameworks	Flask
Libraries	Additional libraries	scikit-learn, pandas, numpy, matplotlib, seaborn
Development Environment	IDE	Jupyter Notebook, pycharm
Data		
Data	Source, size, format	Crop Recommendation Dataset (Kaggle), CSV format (~2,200+ records, 7 input features, 22–23 crop classes)
